

BUS CONFIGURATION MULTIPLEXER

5

ABSTRACT

One embodiment of the invention includes a system for changing a bus
10 configuration of a computing device. The system includes a first bus of the
computing device, a second bus, and a third bus. Additionally, a multiplexing
module is coupled with the first, second, and third buses. As such, the
multiplexing module can selectively couple the first bus with the second bus or
the third bus. A configuration module is coupled with the multiplexing module
15 and controls its operation.
